PROPERTY LISTING GALLERY UNDER BUILDING AND CONSTRUCTION

INTRODUCTION

With the rapid growth of digital platforms, the real estate sector has also shifted towards online property browsing and visualization. People prefer to view property details, images, and features online before making any decision. A Property Listing Gallery is a simple yet effective web-based solution that allows users to explore property information in an organized and visually appealing manner.

This project focuses on designing and developing a static Property Listing Gallery website using HTML and CSS. The system provides a clean layout where different properties can be displayed along with images, titles, descriptions, and basic details. The main objective is to create an attractive gallery interface that enhances user experience while demonstrating front-end web development skills.

The project emphasizes responsive design, structured layout, and effective visual presentation without using complex backend technologies, making it suitable for academic demonstration and learning purposes.

The project is developed with reference to the twin **cities of Hubballi and Dharwad**, Karnataka, which are rapidly growing urban areas with increasing building and construction activities. The system aims to simplify property listing and searching processes for buyers and sellers in this region.

NEED OF THE SYSTEM

SYSTEM ANALYSIS

The real estate market requires an organized method to display property information online. Traditional methods such as newspaper ads, brochures, and physical visits consume time and lack visual clarity. Users need a platform where they can quickly compare properties and view images in a structured format.

This project addresses the need for:

- Easy property browsing
- Organized image presentation
- Attractive and responsive layout
- Simple navigation for users

Existing System

- Scattered property information
- Time-consuming property search
- Lack of proper image gallery
- Dependency on agents
- Unverified property listings
- Complex website navigation

Proposed System

- Sellers upload property details.
- Admin verifies and manages listings.
- Buyers browse properties through a gallery interface.

Aim of the Project

The main aim of this project is to design and develop a visually appealing Property Listing Gallery using HTML and CSS that allows users to view and explore property information efficiently.

OBJECTIVES

- To create a responsive gallery layout
- To display property details in a structured format
- To enhance UI/UX design skills
- To demonstrate front-end development knowledge

Advantages of the Project

- Simple and easy to understand interface
- Attractive property visualization
- Helps users compare properties quickly
- Lightweight and fast loading website
- Improves front-end design skills
- No database dependency (suitable for academic learning)
- Responsive layout for different screen sizes

Modules of the Project

1. Administrator Module

- Login authentication
- Add, edit, or delete property listings
- Verify seller submissions
- Manage buyer and seller information
- Maintain system records

2. Seller Module

- Seller registration and login
- Add property details
- Upload property images
- Update or delete property listings
- View listing status

3. Buyer Module

- Browse property gallery
- View property details
- Search properties by category
- View images and descriptions
- Contact seller/admin

Requirements

Hardware Requirements

- Computer or Laptop
- Minimum 4 GB RAM
- Basic storage space
- Internet connection (optional for development reference)

Software Requirements

- Operating System: Windows / Linux / Mac
- Text Editor: VS Code / Notepad++ / Sublime Text
- Web Browser: Chrome / Edge / Firefox
- Languages Used: HTML and CSS

TIME PLAN

Phase	Activity	Start Date	End Date
Phase 1	Requirement Analysis	09-02-2026	15-02-2026
Phase 2	Design Planning and Layout	16-02-2026	28-02-2026
Phase 3	HTML Structure Development	01-03-2026	10-03-2026
Phase 4	CSS Styling and Gallery Designing	11-03-2026	10-04-2026
Phase 5	Testing and Responsiveness	11-04-2026	25-04-2026
Phase 6	Documentation and Final Submission	26-04-2026	31-05-2026

CONCLUSION

The Property Listing Gallery project successfully demonstrates how front-end web technologies can be used to create an organized and visually appealing property browsing platform. The system provides a simple and effective way to present property information without relying on complex backend systems.

Through this project, important concepts such as responsive design, layout structuring, image galleries, and UI/UX improvement are learned and implemented. The project also strengthens practical knowledge of HTML and CSS, which are essential building blocks of web development.

Overall, this project serves as a strong academic demonstration of front-end development skills and can be further enhanced in the future by integrating backend functionality, database connectivity, and advanced search features.
